# Planning in Labeled Transition Systems

## Planning task

- $S$ : finite set of **states**
- $s_0 \in S$ : **initial state**
- $S_* \subseteq S$ : **goal states**
- $A$ : finite set of **actions**
- $cost : A \mapsto \mathbb{R}^{0+}$ : **action cost**
- $T \subseteq S \times A \times S$ : **deterministic transition relation**  
 $(s, a, t) \in T$ :  $a$  is **applicable** in  $s$  and  $t$  is the resulting state

**Plan**: a sequence of actions consecutively applicable in  $s_0$  and leading to  $s_* \in S_*$

**Cost-optimal planning**: find a plan minimizing summed action cost

**Shortest cost-optimal planning**: find a cost-optimal plan minimizing its length

### Abstract

Heuristic search is used to efficiently solve the single-node shortest path problem in weighted graphs. In practice, however, one is not only interested in finding a short path, but an *optimal* path, according to a certain cost notion. We propose an algebraic formalism that captures many cost notions, like typical Quality of Service attributes. We thus generalize  $A^*$ , the popular heuristic search algorithm, for solving optimal-path problem. The paper provides an answer to a fundamental question for AI search, namely to which general notion of cost, heuristic search algorithms can be applied. We prove correctness of the algorithms and provide experimental results that validate the feasibility of the approach.

### Introduction

Heuristic search (Pearl 1985) is an efficient solution to ex-

applications with QoS (Lluch Lafuente & Montanari 2004; Ferrari & Lluch Lafuente 2004) and soft constraint programming (Bistarelli, Montanari, & Rossi 1997; 2002). However, to the best of our knowledge our work is the first attempt to define an abstract formalism for costs suited for heuristic search algorithms like  $A^*$ .

We first define a suitable algebraic structure for graphs called *cost algebra*. Then, we generalize classical results of heuristic search specially regarding algorithm  $A^*$ , according to a general notion of costs. The paper provides an answer to a fundamental question for AI search, namely to which general notion of cost, heuristic search algorithms can be applied. At the practical front, we provide experiments on different cost algebras explained in this paper along with a real-world application in route-planning (Jabbar 2003) where maps are constructed by bicycle tours. Dur-

# Cost-Algebraic Approach

## Definition

Heuristic for cost-algebraic planning problem:  $h(s) = \langle h_c, h_d \rangle \in \mathbb{R}^{0+} \times \mathbb{R}^{0+}$

## Admissibility

$h$  is **admissible** if for a shortest cost-optimal plan  $\pi$  from  $s$ , we have  $h_c \leq \text{cost}(\pi)$  and  $h_d \leq |\pi|$ .

# Cost-Algebraic Approach

## Definition

Heuristic for cost-algebraic planning problem:  $h(s) = \langle h_c, h_d \rangle \in \mathbb{R}^{0+} \times \mathbb{R}^{0+}$

## Admissibility

$h$  is **admissible** if for a shortest cost-optimal plan  $\pi$  from  $s$ , we have  $h_c \leq \text{cost}(\pi)$  and  $h_d \leq |\pi|$ .

## Cost-Algebraic A\*

- 1 Open list prioritizes by  $\langle f_c, f_d \rangle$ , where  $f_c = g_c + h_c$  and  $f_d = g_d + h_d$ , using the lexicographical order.
- 2 Reopen if  $g_c < g'_c$  or if  $g_c = g'_c$  and  $g_d < g'_d$ .

# Cost-Algebraic Heuristic

## Computation

- $h_c$ : Any admissible heuristic for  $\Pi$

# Cost-Algebraic Heuristic

## Computation

- $h_c$ : Any admissible heuristic for  $\Pi$
- $h_d$ : Any admissible heuristic for  $\Pi$  transformed to unit costs

# Cost-Algebraic Heuristic

## Computation

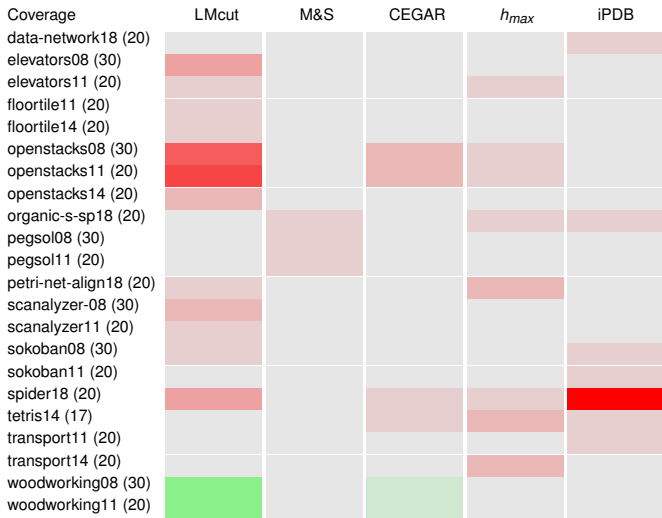

- $h_c$ : Any admissible heuristic for  $\Pi$
- $h_d$ : Any admissible heuristic for  $\Pi$  transformed to unit costs
- Might be lower than necessary

# Cost-Algebraic Heuristic

## Computation

- $h_c$ : Any admissible heuristic for  $\Pi$
- $h_d$ : Any admissible heuristic for  $\Pi$  transformed to unit costs
- Might be lower than necessary
- Not clear whether it will pay off. Also possible to use  $h_d = 0$ .

# Cost Transformation Approach

## Theorem

We can transform the action costs of task  $\Pi$  so that cost-optimal plans of the resulting task are shortest cost-optimal plans of  $\Pi$ .

# Cost Transformation Approach

## Theorem

We can transform the action costs of task  $\Pi$  so that cost-optimal plans of the resulting task are shortest cost-optimal plans of  $\Pi$ .

## Idea

- Increase the cost of every action by a small  $\epsilon$ .  
(cf. Richter & Westphal JAIR 2010, Corrêa et. al., IJCAI 2018)
- Choose  $\epsilon$  small enough so that for any relevant action sequences  $\pi$  and  $\pi'$ , if  $cost(\pi) < cost(\pi')$ , then  $cost'(\pi) < cost'(\pi')$ .

# Cost Transformation Approach

## Theorem

We can transform the action costs of task  $\Pi$  so that cost-optimal plans of the resulting task are shortest cost-optimal plans of  $\Pi$ .

## Idea

- Increase the cost of every action by a small  $\epsilon$ .  
(cf. Richter & Westphal JAIR 2010, Corrêa et. al., IJCAI 2018)
- Choose  $\epsilon$  small enough so that for any relevant action sequences  $\pi$  and  $\pi'$ , if  $cost(\pi) < cost(\pi')$ , then  $cost'(\pi) < cost'(\pi')$ .
- Large enough  $M$ : equivalent integer cost function  $cost_M(a) = M \cdot cost(a) + 1$ . Cost transformed task denoted by  $\Pi_M$ .

# Cost Transformation Heuristics

- Heuristic on cost transformed task (may slow down heuristic computation)
- Heuristic on original task, scaled

## Theorem

If  $h$  is an admissible estimate for state  $s$  in  $\Pi$  then  $Mh$  is admissible for  $s$  in  $\Pi_M$ .
