# **Bounded Intention Planning Revisited**

Silvan Sievers, Martin Wehrle and Malte Helmert

University of Basel, Switzerland

#### Introduction

Recent large interest in pruning methods for optimal planning

# Two existing methods:

- Bounded Intention Planning (BIP) (Wolfe and Russell 2011)
- Stubborn Sets (e.g. Valmari 1989, Wehrle and Helmert 2014)
- Our contribution: Relate BIP to strong stubborn sets

## Stubborn Sets – High Level Idea

# At state *s*, restrict branching to $T_s \subseteq \mathcal{O}$

# Contribution – Relation of BIP to SSS

Let s be a solvable state, let P<sub>s</sub> be the set of applicable operator partitions in s

#### Theorem

For every  $X \in P_s$ ,  $T_s := X \cup \{o \mid o \text{ interferes with } o' \in X\}$  satisfies conditions (1) and (2) of the GSSS definition.

Operators *o* interfering with *X* are not applicable in *s X* constitutes a necessary enabling set for all such *o*

- > Applicable operators not in  $T_s$  remain applicable
- Avoid looking at all permutations of an operator sequence leading to the same state

#### **Stubborn Sets – More Details**

Operator set  $T_s \subseteq \mathcal{O}$  is a generalized strong stubborn set (GSSS) in solvable state *s* iff:

1.  $T_s$  contains all operators interfering with applicable operators from  $T_s$ 2.  $T_s$  contains a necessary enabling set for all inapplicable operators in  $T_s$ 3.  $T_s$  contains at least one operator starting a strongly optimal *s*-plan

## **Bounded Intention Planning – High Level Idea**

- Method for domains with unary operators and acyclic CGs
- Repeatedly choose a subgoal
- Only plan for subgoal, avoiding unnecessary interleavings
- To do so, use augmented representation to explicitly set intention variables (representing subgoals)

#### **Bounded Intention Planning – Operator Partitioning**

#### Theorem

For at least one  $X \in P_s$ ,  $T_s := X \cup \{o \mid o \text{ interferes with } o' \in X\}$  satisfies condition (3) of the GSSS definition for and hence is a GSSS with the same applicable operators as *X*.

- From s solvable, there exists an operator o starting a strongly optimal s-plan
- ►  $P_s$  contains exactly the applicable operators, hence o is in some  $X \in P_s$

#### **Theorems – Remarks**

Preferably select partitions that correspond to a GSSS
 Problem: computationally hard to find those

#### Conclusion

BIP's operator partitioning is a variant of a stubborn method:

## When expanding states:

- Partition operators with identical preconditions and prevail conditions
- Choose arbitrary partition: branch only inside partitions

#### **BIP Theorem 2 (Wolfe and Russell 2011)**

For every state *s* and applicable operator partition *p* there exists an optimal *s*-plan that begins with an operator in *p*.

- All partitions induce sets that satisfy conditions (1) and (2) of the GSSS definition (semistubborn sets)
- At least one partition induces a GSSS

#### **Future work**

- What is the pruning power of BIP?
- Can BIP be generalized to arbitrary operators?
  - $\Rightarrow$  Starting point: GSSS defined for arbitrary operators

#### **Bounded Intention Planning – Example**

► Example planning task:
► V: v, w, D(v) = D(w) = {0, 1}
► O: o<sub>v</sub> = (v = 0; v = 1; Ø), o<sub>w</sub> = (w = 0; w = 1; Ø)
► s<sub>0</sub>: v = 0, w = 0
► s<sub>\*</sub>: v = 1, w = 1

\$\vec{s}\_0\$: applicable partitions
 \$\vec{SetO}\_{v=0} = {\vec{SetO}(o\_v), Freeze(v, 0)}\$
 \$\vec{SetO}\_{w=0} = {\vec{SetO}(o\_w), Freeze(w, 0)}\$

\$\vec{s}\_0\$: inapplicable partitions
\$\vec{SetO}\_{v=1} = {\vec{Freeze}(v, 1)}\$
\$\vec{SetO}\_{w=1} = {\vec{Freeze}(w, 1)}\$
\$\vec{Fire}\_{o\_v} = {\vec{Fire}(o\_v)}\$
\$\vec{Fire}\_{o\_w} = {\vec{Fire}(o\_w)}\$

Augmented search space:

Augmented planning task: (simplified – without extra goal variable) *V*: *v*, *w*, *O<sub>v</sub>*, *O<sub>w</sub>*, *C<sub>v</sub>*, *C<sub>w</sub> O*:
SetO(*o<sub>v</sub>*) = (*O<sub>v</sub>* = *free*; *O<sub>v</sub>* = *o<sub>v</sub>*; *v* = 0)
SetO(*o<sub>w</sub>*) = (*O<sub>v</sub>* = *free*; *O<sub>w</sub>* = *o<sub>w</sub>*; *w* = 0)
Freeze(*v*, 0) = (*O<sub>v</sub>* = *free*; *O<sub>v</sub>* = *frozen*; *v* = 0)
Freeze(*v*, 1) = (*O<sub>v</sub>* = *free*; *O<sub>v</sub>* = *frozen*; *v* = 1)
Freeze(*w*, 0) = (*O<sub>w</sub>* = *free*; *O<sub>w</sub>* = *frozen*; *w* = 1)
Freeze(*w*, 1) = (*O<sub>w</sub>* = *free*; *O<sub>w</sub>* = *frozen*; *w* = 1)
Freeze(*w*, 1) = (*O<sub>w</sub>* = *free*; *O<sub>w</sub>* = *frozen*; *w* = 1)
Freeze(*w*, 1) = (*O<sub>w</sub>* = *free*; *O<sub>w</sub>* = *frozen*; *w* = 1)
Fire(*o<sub>v</sub>*) = (*v* = 0, *O<sub>v</sub>* = *o<sub>v</sub>*; *v* = 1, *O<sub>v</sub>* = *free*; Ø)
Fire(*o<sub>w</sub>*) = (*w* = 0, *O<sub>w</sub>* = *o<sub>w</sub>*; *w* = 1, *O<sub>w</sub>* = *free*; Ø) *F*<sub>o</sub>: *v* = 0, *w* = 0, *O<sub>v</sub>* = *f*<sub>ree</sub>, *O<sub>w</sub>* = *f*<sub>ree</sub>; Ø) *S*<sub>o</sub>: *v* = 0, *w* = 0, *O<sub>v</sub>* = *f*<sub>ree</sub>, *O<sub>w</sub>* = *f*<sub>ree</sub>; Ø) *S*<sub>o</sub>: *v* = 0, *w* = *f*<sub>ree</sub> *S*<sub>x</sub> = *S<sub>x</sub>*
